

Accounting for the effects of the environment on the development of the brain and behavior is a central theme in the study of human development. This paper reviews the current state of knowledge on the topic, focusing on the role of the environment in the development of the brain and behavior. The review is organized into three main sections: (1) the role of the environment in the development of the brain, (2) the role of the environment in the development of behavior, and (3) the role of the environment in the development of the brain-behavior relationship. The first section discusses the role of the environment in the development of the brain, focusing on the role of the environment in the development of the brain's structure and function. The second section discusses the role of the environment in the development of behavior, focusing on the role of the environment in the development of behavior's patterns and processes. The third section discusses the role of the environment in the development of the brain-behavior relationship, focusing on the role of the environment in the development of the brain-behavior relationship's patterns and processes. The review concludes with a discussion of the implications of the findings for the study of human development.
